

This sealant helps to seal leaking vases and similar objects if these are not used for cooking or hot drinks and any kind of food.

If used correctly the treated ceramic pieces are watertight and do not change their appearance.

After treatment a light silky gloss appears on most of the ceramic pieces.

Dichtungsmittel 115/ sealant is not harmful to health.

Instructions for use:

For unglazed objects Dichtungsmittel 115/ is to be used almost pure, for glazed objects it needs to be thinned with water.

The following basically applies: the finer the hair cracks or pores the more the sealant has to be thinned with water.

Mixing ratio:

1 volume fraction sealant "Dichtungsmittel 115/"

1 – 4 volume fraction water

Before and during usage the sealant or your mixture with water needs to be stirred well.

The objects to be sealed need to be dry and not too cold (should have room temperature, appr. 20°C).

Rinse the vase/object with the sealant or fill it up with it. Pour it out right away or latest after 10-15 minutes (make a few tests before final use).

The sealant runs into the hair cracks and seals the ceramic while curing.

If a white film appears on the glaze/surface the mixture was too concentrated or it has stayed in the object for too long.

In such cases please

- thin the sealant with water and/or
- pour it out after a shorter time and/or
- wipe the remaining emulsion from the surface with a sponge

Make a few tests to obtain good results!

Attention

Sealant "Dichtungsmittel 115/" is not frost resistant.

Sealant "Dichtungsmittel 115/" cannot be fired after application. It can only be used on the fired object.

We cannot guarantee a resistance to dishwashing detergent.
